

ZAP Scanning Report

Site: http://host.docker.internal:8000

Generated on Thu, 30 Apr 2026 21:31:01

ZAP Version: 2.17.0

ZAP by [Checkmarx](#)

Summary of Alerts

Risk Level	Number of Alerts
High	0
Medium	0
Low	2
Informational	3
False Positives:	0

Insights

Level	Reason	Site	Description	Statistic
Low	Warning		ZAP warnings logged - see the zap.log file for details	15
Low	Exceeded High	http://host.docker.internal:8000	Percentage of responses with status code 4xx	99 %
Info	Informational	http://host.docker.internal:8000	Percentage of endpoints with content type application/json	100 %
Info	Informational	http://host.docker.internal:8000	Percentage of endpoints with method DELETE	7 %
Info	Informational	http://host.docker.internal:8000	Percentage of endpoints with method GET	48 %
Info	Informational	http://host.docker.internal:8000	Percentage of endpoints with method POST	37 %
Info	Informational	http://host.docker.internal:8000	Percentage of endpoints with method PUT	7 %
Info	Informational	http://host.docker.internal:8000	Count of total endpoints	110

Summary of Sequences

For each step: result (Pass/Fail) - risk (of highest alert(s) for the step, if any).

Alerts

Name	Risk Level	Number of Instances
Cross-Origin-Resource-Policy Header Missing or Invalid	Low	1
X-Content-Type-Options Header Missing	Low	1
A Client Error response code was returned by the server	Informational	110
Non-Storable Content	Informational	Systemic
Storable and Cacheable Content	Informational	1

Alert Detail

Low	Cross-Origin-Resource-Policy Header Missing or Invalid
Description	Cross-Origin-Resource-Policy header is an opt-in header designed to counter side-channels attacks like Spectre. Resource should be specifically set as shareable amongst different origins.
URL	http://host.docker.internal:8000/openapi.json
Node Name	http://host.docker.internal:8000/openapi.json
Method	GET
Parameter	Cross-Origin-Resource-Policy
Attack	
Evidence	
Other Info	
Instances	1
Solution	Ensure that the application/web server sets the Cross-Origin-Resource-Policy header appropriately, and that it sets the Cross-Origin-Resource-Policy header to 'same-origin' for all web pages. 'same-site' is considered as less secured and should be avoided. If resources must be shared, set the header to 'cross-origin'. If possible, ensure that the end user uses a standards-compliant and modern web browser that supports the Cross-Origin-Resource-Policy header (https://caniuse.com/mdn-http_headers_cross-origin-resource-policy).
Reference	https://developer.mozilla.org/en-US/docs/Web/HTTP/Reference/Headers/Cross-Origin-Embedder-Policy
CWE Id	693
WASC Id	14
Plugin Id	90004
Low	X-Content-Type-Options Header Missing

Description	The Anti-MIME-Sniffing header X-Content-Type-Options was not set to 'nosniff'. This allows older versions of Internet Explorer and Chrome to perform MIME-sniffing on the response body, potentially causing the response body to be interpreted and displayed as a content type other than the declared content type. Current (early 2014) and legacy versions of Firefox will use the declared content type (if one is set), rather than performing MIME-sniffing.
URL	http://host.docker.internal:8000/openapi.json
Node Name	http://host.docker.internal:8000/openapi.json
Method	GET
Parameter	x-content-type-options
Attack	
Evidence	
Other Info	This issue still applies to error type pages (401, 403, 500, etc.) as those pages are often still affected by injection issues, in which case there is still concern for browsers sniffing pages away from their actual content type. At "High" threshold this scan rule will not alert on client or server error responses.
Instances	1
Solution	Ensure that the application/web server sets the Content-Type header appropriately, and that it sets the X-Content-Type-Options header to 'nosniff' for all web pages. If possible, ensure that the end user uses a standards-compliant and modern web browser that does not perform MIME-sniffing at all, or that can be directed by the web application/web server to not perform MIME-sniffing.

Informational	Non-Storable Content
Description	The response contents are not storable by caching components such as proxy servers. If the response does not contain sensitive, personal or user-specific information, it may benefit from being stored and cached, to improve performance.

Instances	Systemic
Solution	The content may be marked as storable by ensuring that the following conditions are satisfied: The request method must be understood by the cache and defined as being cacheable ("GET", "HEAD", and "POST" are currently defined as cacheable) The response status code must be understood by the cache (one of the 1XX, 2XX, 3XX, 4XX, or 5XX response classes are generally understood) The "no-store" cache directive must not appear in the request or response header fields For caching by "shared" caches such as "proxy" caches, the "private" response directive must not appear in the response

	For caching by "shared" caches such as "proxy" caches, the "Authorization" header field must not appear in the request, unless the response explicitly allows it (using one of the "must-revalidate", "public", or "s-maxage" Cache-Control response directives) In addition to the conditions above, at least one of the following conditions must also be satisfied by the response: It must contain an "Expires" header field It must contain a "max-age" response directive For "shared" caches such as "proxy" caches, it must contain a "s-maxage" response directive It must contain a "Cache Control Extension" that allows it to be cached It must have a status code that is defined as cacheable by default (200, 203, 204, 206, 300, 301, 404, 405, 410, 414, 501).

CWE Id	524
WASC Id	13
Plugin Id	10049

Informational	Storable and Cacheable Content
Description	The response contents are storable by caching components such as proxy servers, and may be retrieved directly from the cache, rather than from the origin server by the caching servers, in response to similar requests from other users. If the response data is sensitive, personal or user-specific, this may result in sensitive information being leaked. In some cases, this may even result in a user gaining complete control of the session of another user, depending on the configuration of the caching components in use in their environment. This is primarily an issue where "shared" caching servers such as "proxy" caches are configured on the local network. This configuration is typically found in corporate or educational environments, for instance.
URL	http://host.docker.internal:8000/openapi.json
Node Name	http://host.docker.internal:8000/openapi.json
Method	GET
Parameter	
Attack	
Evidence	
Other Info	In the absence of an explicitly specified caching lifetime directive in the response, a liberal lifetime heuristic of 1 year was assumed. This is permitted by rfc7234.
Instances	1

Solution	Validate that the response does not contain sensitive, personal or user-specific information. If it does, consider the use of the following HTTP response headers, to limit, or prevent the content being stored and retrieved from the cache by another user: Cache-Control: no-cache, no-store, must-revalidate, private Pragma: no-cache Expires: 0 This configuration directs both HTTP 1.0 and HTTP 1.1 compliant caching servers to not store the response, and to not retrieve the response (without validation) from the cache, in response to a similar request.
